

Abstract: The *Robot Framework* is a generic Test Automation Framework for acceptance testing. It has a flexible keyword-driven approach to describe and implement tests.

Keywords can be stored in Resource-Files to separate implementation details from tests. Main programming languages for implementing test functionality are Java and Python.

There are ready-made test libraries available for a lot of technologies. Implementing tests is supported by the Robot Framework IDE(RIDE).

Available Test Libraries

- BuildIn
- Dialogs
- Collections
- OperatingSystem
- Remote
- Screenshot
- String
- Telnet
- XML
- Android Library
- Anywhere Library
- Appium Library
- Archive Library
- Autolt Library
- Database Library
- Diff Library
- Eclipse Library
- robotframework-faker
- FTP Library
- HTTP Library
- iOS Library
- MongoDB Library
- Rammbock
- RemoteSwingLibrary
- SeleniumLibrary
- Selenium2Library
- SSH Library
- Suds Library
- Swing Library
- watir-robot

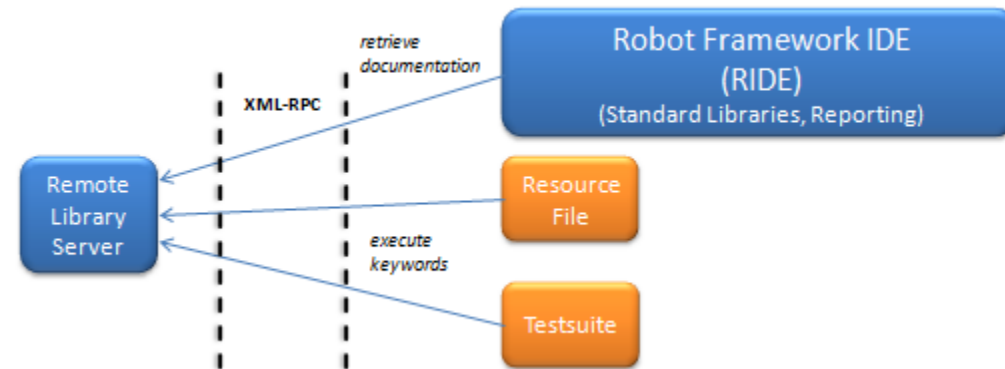

Example – Test Case and Keyword

```
*** Setting ***
Library      OperatingSystem

*** Test Case ***
Windows Directory Not Empty
  [Documentation]  Directory must not be empty.
  [Tags]    windows    directory
  ${FILENUM}=    Number of Files in Directory
  Should Not Be Equal As Numbers    0    ${FILENUM}

*** Keywords ***
Number of Files in Directory
  ${NUM}=    Count Files In Directory    C:\\WINDOWS
  Log    ${NUM}
  [Return]    ${NUM}
```

Accessing Test Libraries remotely using XML-RPC

```
Library    org.robot.database.keywords.DatabaseLibrary    <- lokal
Library    Remote    http://localhost:8271                <- remote
```

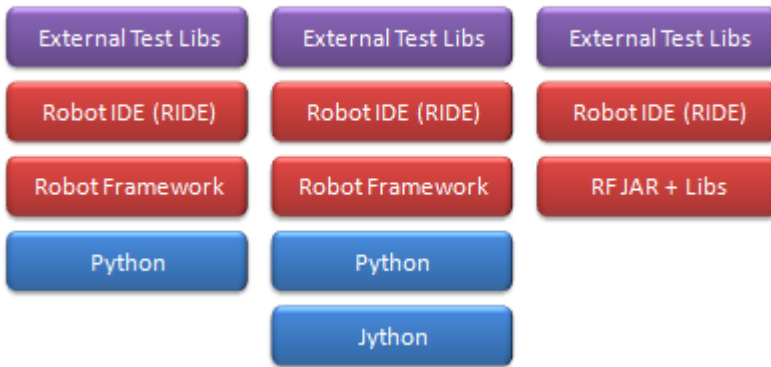

<http://www.robotframework.org>
<https://groups.google.com/forum/#!forum/robotframework-users>
<https://code.google.com/p/robotframework-ride/>

```
pybot|jybot|ipybot [options] data_sources
java -jar robotframework.jar [options] data_sources
```

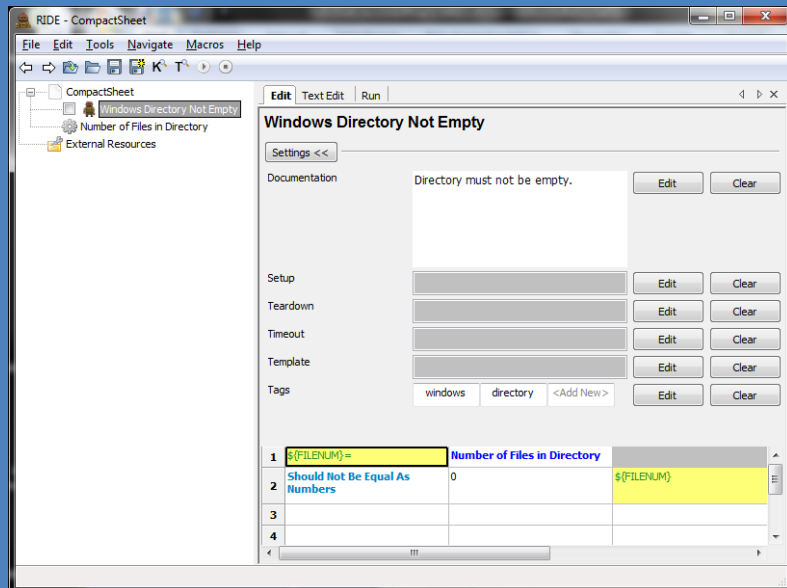

Minimal Stack

Jython Stack

JAR Stack

RIDE: Graphical User Interface for writing Tests and Keywords. It supports for example auto-completion and syntax highlighting. Allows direct editing of the source files.

Example – Keyword Implementation in Java

```
public class DatabaseLibrary {
    public static final String ROBOT_LIBRARY_SCOPE = "GLOBAL";

    private Connection connection = null;

    public void connectToDatabase(String driverClassName,
                                String connectionString,
                                String dbUser,
                                String dbPassword)
        throws SQLException,
        InstantiationException,
        IllegalAccessException,
        ClassNotFoundException {
        Class.forName(driverClassName).newInstance();

        setConnection(DriverManager.getConnection(connectionString,
                                                  dbUser,
                                                  dbPassword));
    }

    public void disconnectFromDatabase() throws SQLException {
        getConnection().close();
    }

    public void tableMustExist(String tableName)
        throws SQLException,
        DatabaseLibraryException {
        DatabaseMetaData dbm = getConnection().getMetaData();

        ResultSet rs = dbm.getTables(null, null, tableName, null);

        try {
            if (!rs.next()) {
                throw new DatabaseLibraryException("Table: " +
                                                    tableName +
                                                    " was not found");
            }
        } finally {
            rs.close();
        }
    }
}
```

Tools

- **Rebot** - generating logs and reports based on XML outputs and for combining multiple outputs together.
- **Libdoc** - generating keyword documentation for test libraries and resource files.
- **Testdoc** - Generates high level HTML documentation based on Robot Framework test cases.
- **Tidy** - Tool for cleaning up and changing format of Robot Framework test data files.

Build Support

- **Jenkins Plugin** - To collect and publish Robot Framework test results in Jenkins.
- **Maven Plugin** - For using Robot Framework.
- **Ant Task** - For running Robot Framework tests.

Sample Reports

Login Tests Test Report

Summary Information

Status: 6 critical tests failed
 Start Time: 20080113 14:12:38.445
 End Time: 20080113 14:12:39.405
 Elapsed Time: 00:00:01.022

Test Statistics

Total Statistics	Total	Pass	Fail
Critical Tests	10	0	6
All Tests	10	0	6

Test Details by Suite

Suite	Test	Status
loginTests	loginTests.Login	FAIL
loginTests	loginTests.Login	FAIL
loginTests	loginTests.Login	FAIL
loginTests	loginTests.Login	FAIL
loginTests	loginTests.Login	FAIL
loginTests	loginTests.Login	FAIL

loginTests	loginTests.Login	PASS
loginTests	loginTests.Login	PASS
loginTests	loginTests.Login	PASS
loginTests	loginTests.Login	PASS
loginTests	loginTests.Login	PASS
loginTests	loginTests.Login	PASS

Combining Keywords to higher-level Keywords

Testing variations using the Generic Testdata Framework AddOn

This AddOn supports testing when a lot of variations should be tested for one functionality. For example in insurance companies where certain calculations should be tested with a lot of different input values and expected results.

It also supports separation of implementation details from the tests to a greater degree by allowing Tests to be written in Excel.

7	## Calculator Function X Tests		
8	## Scenario	Testcase	Testcase Description
9	calculatorFunctionXTests	Function X Test 1	Description for function x test 1
